EXAMINER'S AMENDMENT

1. An Examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to Applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with **Mr. Mark Kusner, Reg. No. 31,115 on 03/01/20002.**

The application has been amended as follows:

Claim 12, line 4 of the claim, please replace [reduced cross-sectional area] with -- increased resistance--.

Claim 13, first line of the claim, following "region", please insert --of increased resistance--.

2. The following is an Examiner's statement of reasons for allowance:

The allowability resides in the overall structure of the device as claimed at least in independent claims 1, 10, and 14, and at least in part, because of the following:

US/5,994,993 to Castonguay (submitted with IDS) is believed to be closest to the device structure of the present invention as claimed in independent claim 14. Castonguay disclosed (Fig. 4 and 6-9) an electric fuse, comprised of:

a tubular fuse casing (30) formed of electrically insulating material;

a first conductive component (32) attached to a first end of said casing (30); a second conductive component (32) attached to a second end of said casing (30);

a fusible element within said casing (30) (column 2, line 36) electrically connected to said first and second conductive components (32), said first fusible element having a first resistance; an indicator (Fig. 6-9) on said casing (30), said indicator, comprised of:

a first layer (50) comprised of a non-flammable material ; and a second layer (52) comprised of conductive material deposited on said first layer (50), (column 4, lines 40+), said second layer (52) having a gap (58), said indicator mounted to said casing (30) with said second layer (52) electrically connected to said first and second conductive elements (32) in parallel with said fusible element and with said first layer (50) between said second layer (52) and said casing (30); and a third layer (56) of clear polymeric material covering said indicator, but did not disclose that said second layer having an area of reduced thickness and a predetermined resistance greater than the resistance of said fusible element, wherein said area of reduced thickness is visible through said third layer, as claimed in claim 14. Castonguay is teaching away from the present invention, since it teaches a gap (58) in said second layer (52), thus departing from operating principles of the instant invention, which require a continuous conductive second layer.

US/ 809,978 to Ogle is believed to be closest to the device structure of the present invention as claimed in independent claims 1 and 10. Ogle disclosed (Fig. 1, 3, 5, and 6) an electric fuse, comprised of:

a tubular fuse casing (2) formed of electrically insulating material;
a first conductive component (3) attached to a first end of said casing (2); a second conductive component (3) attached to a second end of said casing (2);

Art Unit: 2835

a first conductive path formed by a fusible element (4) within said casing (3) electrically connected to said first and second conductive components (3), said first conductive path having a first resistance; and

a second conductive path (5, 7) extending along the exterior of said tubular fuse casing (2), said conductive path being in parallel to said first conductive path (4), and having a second resistance greater than said first resistance and including an indicator component (Fig. 6), said indicator component comprising of:

a first layer (9) providing a visual indication of color; a wire filament (7) disposed under said first layer (9);

a cavity (8) located above said first layer (9) and said wire filament (7);

and a third layer (10) comprised of transparent material covering said cavity (8), said first layer (9) and said filament (7), but did not disclose a second conductive layer including at least one metal layer on said first layer and having a region of increased resistance, as claimed in claims 1 and 10.

The following prior art made of record is considered pertinent to Applicant's disclosure:

US/6292087, 1087120, 2175250, 737368, 792530, 737369, 737280, 1014741, 1040150, 737281, EP/0213404, and DE/3332839 disclosed fuses comprising fuse state indicators.

The recitations of independent claims 1, 10, and 14 discussed above, in combination with the remaining limitations of the claims are believed to render said claims patentable over the art of record.

None of the cited references either taken alone or in combination, is believed to render the present invention unpatentable as claimed.

Conclusion

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
